

How Do Whitescmile Clear Aligners work?

Whitesmile Clear® Aligner is perfectly engineered to align the teeth. Over time, the aligner gently moves teeth and roots to their appropriate position. The patient must wear the aligner as instructed by a certified Whitesmile Clear clinician before advancing sequentially to new sets of aligners.

The step-by-step process of wearing the aligner helps to re-position the teeth with proper force until the alignment of the teeth is complete. This methodology uses both the expertise of our Whitesmile Clear trained clinicians as well as artificial intelligence to attain alignment.

Whitesmile Clear® Aligner uses a proprietary material which is known as "Tristar", it provides double the effectiveness of off the shelf aligner materials yet minimizing any discomfort the patient may have while wearing the aligner. **Learn more about Tristar at alignermaterial.com**

Every Whitesmile Clear clinician undergoes a certification process and ongoing training to provide the best treatment for you. **Learn more about Whitesmile Clear by visiting whitesmileclear.com**

What is Whitesmile Clear?

Whitesmile Clear is a virtually Invisible treatment system that uses the latest digital technology to gently and effectively straighten teeth.

Whitesmile Clear can be used to treat children and adults. In children, it is an especially comfortable method of treatment for children when compared to traditional methods and can help to prevent more severe problems from happening later.

Whitesmile Clear Treatment Result With The Tristar Material

Especially for teens and adults, Whitesmile Clear is a comfortable and aesthetic alternative to traditional braces treatment. Whitesmile Clear provides proven treatment results and you can see results of your new smile in as little as six months.

3 Three simple steps to a brand-new smile

01

Every smile starts with an initial consultation

Meet your dentist and start your smile transformation. By using the digital intraoral scanner, your dentist can take a rapid yet precise digital scan of your mouth and configure a custom plan just for you.

02

Transform your smile right from the first stage

Your dentist will ensure your aligners fit well, and guide you through all of your questions. The Tristar material provides gentle, yet consistent force delivery to start transforming your smile. Learn more about the Tristar material here (alignermaterial.com). Enjoy your lifestyle uninterrupted: These discrete, yet effective aligners allow you to enjoy your favourite foods, and makes oral hygiene a breeze!

03

Keep it beautiful

You have transformed your smile using the world's best aligner system. It is easy to retain the result you will love by using our Smilekeeper retainer. Each Smilekeeper retainer is fabricated from a customized material that is almost twice as strong as the competition.

Why Do Children require Aligner treatment?

The American association of orthodontists recommend an evaluation at age 7. Their teeth may be crooked, overlapping, overcrowded, or they have malocclusion, a condition in which the upper and lower teeth do not fit together properly. An overbite means the upper jaw is larger or protruding, while an underbite means the lower jaw is larger or protruding.

Sometimes tooth and jaw problems are the results of premature baby tooth loss, accidents, or habits like prolonged use of pacifiers and baby bottle use or thumb sucking. The need for treatment can be an inherited trait. So, if you need braces, your child may need them as well.

✓ Straight talk about your alignment problems: Malocclusion means abnormal tooth alignment

Crowding occasionally results in difficult flossing, abnormal wear on teeth and food traps

Gapped teeth can result in food traps, difficulties in speech (lisp) and in the long term may result in some gum problems (recession) if left untreated

Deep bites may result in trauma upon biting to the gum line as well as premature damage to the surfaces of teeth

Excessive overjet – Teeth which protrude excessively are more prone to damage and wear to their surfaces

In an edge to edge or reverse overjet the lower teeth are contacting against or ahead of the upper teeth which can result in difficulty chewing or premature wear to teeth.

In an open bite, the teeth are unable to come into contact and cause difficulty in chewing food

Narrow arch: A narrow arch prevents proper alignment of teeth and also causes premature wear and chipping of the tooth surface
